3. Thanu sree

Summary

Problem Statement

In today's hyper-connected digital landscape, humans remain the weakest link in the cybersecurity chain. While technological defences like firewalls and encryption have evolved significantly, social engineering attacks—such as deepfakes, highly targeted phishing, and digital arrests—continue to exploit human psychology. Traditional cybersecurity training often relies on passive learning methods (like static presentations and videos) that fail to engage users or provide practical, hands-on experience in identifying and mitigating real-time threats. There is a critical need for an interactive, experiential learning platform that bridges the gap between theoretical knowledge and practical application, effectively patching the "human vulnerability" in cybersecurity.

Objectives

1. **Interactive Education:** To create a gamified learning environment that immerses users in realistic cyber-threat scenarios, shifting from passive training to active, decision-based learning.
2. **Behavioural Conditioning:** To train users to instinctively recognize red flags and employ defensive behaviours when faced with modern social engineering tactics.
3. **Comprehensive Threat Coverage:** To educate users on the latest emerging cyber threats, including AI-driven deepfakes, sophisticated impersonation, fraudulent applications, and rogue networks.
4. **Accessibility & Broad Reach:** To ensure maximum accessibility and widespread adoption by providing a seamless, multi-platform experience.

Prototype Overview

"Secure the assets simulator" is an interactive, multi-platform 2D role-playing game designed to train individuals against real-world cyber threats through immersive gameplay. To ensure accessibility for all users, the game is built to run natively across **Android, Windows, and Web browsers**.

The core experience is divided into two distinct, complementary gameplay modes:

1. Story Mode

Story Mode places the player in the shoes of a protagonist navigating everyday digital life. At the start of the campaign, the player is given a simulated bank balance of **₹42 Lakhs**, which they must carefully protect from various sophisticated cyber attacks as they progress through the narrative. Each level meticulously recreates a highly realistic, scenario-based threat, requiring the player to investigate clues, interact with their environment (such as simulated computers, smartphones, and NPCs), and make critical decisions to avoid being scammed. The educational scenarios include:

- **Digital Arrest Scams:** Navigating high-pressure, fake law enforcement video calls designed to extort money through fear.
- **Deepfake & Audio Cloning:** Identifying AI-generated voice and video impersonations used to bypass trust.
- **Malicious QR Codes :**Understanding the hidden risks of scanning unverified payment codes in public spaces.
- **Impersonation Attacks:** Dealing with bad actors pretending to be neighbours, friends, or trusted officials.
- **Fake Applications:** Spotting and avoiding fraudulent mobile apps designed to steal credentials and financial data.
- **Open Networks (Rogue Wi-Fi):** Experiencing the dangers of connecting to and transacting on unsecured, public networks.

2. Defence Mode

Defence Mode serves as the active training and reinforcement hub of the game. It is designed to solidify the knowledge players acquire during the Story Mode through fast-paced, interactive challenges and continuous learning.

- **Cyber Awareness Mini-Games:** Features a diverse collection of quick, focused mini-games tailored to specific threat vectors (e.g., rapidly sorting legitimate emails from phishing attempts).
- **Interactive Quizzes:** Dynamic, scenario-based quizzes that test the player's ability to apply their knowledge under pressure.
- **Training Sessions:** Practical modules where players can drill specific skills to increase their overall "cyber defence stats," ensuring they are prepared before facing higher-stakes levels in Story Mode.

By combining narrative-driven stakes (Story Mode) with rigorous, repetitive skill-building (Defence Mode), "Secure the assets simulator" effectively upgrades the user's awareness, serving as the ultimate patch for human vulnerability.
